# Hereditary Breast & Ovarian Cancer in Jewish Women

- Approximately 10% of all breast and ovarian cancers are hereditary.
  - A mutation in the BRCA 1 and BRCA 2 gene is associated with hereditary breast and ovarian cancer. These mutations can be inherited from either parent.
  - 1 out of 40 people of Ashkenazi Jewish (Central or Eastern European) descent has inherited a mutation in the BRCA 1 or BRCA 2 gene which gives them a 33-50% risk of developing breast cancer by age 50 and 56-87% risk by age 70.
  - 1 out of 40 people of Ashkenazi Jewish descent also has a 27-44 % risk of developing ovarian cancer by age 70 as the result of an inherited BRCA 1 or BRCA 2 mutation.
- Any of the following risk factors significantly increase the possibility of having a BRCA 1 or BRCA 2 gene mutation:
- A personal history of breast cancer before age 50 or ovarian cancer at any age.
  - A family member with a BRCA 1 or BRCA 2 gene mutation.
  - A family member with breast cancer under the age of 50 or ovarian cancer at any age.
  - A male family member with breast cancer.

# Hereditary Breast & Ovarian Cancer in Jewish Women

**IS THERE A  
TEST TO  
FIND OUT  
IF I HAVE  
THIS  
GENE  
MUTATION?**

- A simple blood test is all that is needed to detect mutations in the genetic code of BRCA 1 or BRCA 2.

- A healthcare provider or genetic counselor can evaluate your personal and family medical history and discuss whether the test is right for you.

**WHAT ARE  
THE BENEFITS  
OF  
GENETIC  
TESTING?**

- If you have an increased hereditary risk, earlier screening and other preventive measures are available.

- Even if you already have been diagnosed with breast or ovarian cancer, genetic information can be used to make important treatment decisions.

- If you have a family history of breast and ovarian cancer, you may learn that you do not have the BRCA mutation.

- With genetic information and appropriate medical intervention, you can reduce your risk of breast and ovarian cancer up to 96%.
